Late Delivery and Customer Satisfaction at Olist

To: Chief Operating Officer | **From:** Bhupesh, Data Analyst, Operations & Customer Experience | **Date:** 26 October 2026

Bottom line

Late delivery is strongly associated with poor reviews, and the damage is concentrated in places we can act on. Most orders arrive on time (93.2%), but R$720.9K of order value sits in late orders rated 1–2★. I recommend focusing first on high-value orders and on the worst-performing states and sellers.

What the data shows

- **Scale:** 93.2% of 96,476 delivered orders arrived on or before the estimated date; 6,535 were late.
- **Impact on ratings:** 62% of on-time orders get 5★, while 70% of orders 8+ days late get 1★. At 1–3 days late, customers split (25% give 1★, 33% give 5★), so the length of delay alone does not decide the rating.
- **Where it concentrates:** Alagoas (AL) is the worst state at 21.4% late versus 6.8% overall; audio is the worst category (11.6%); the worst seller was late on about 21% of 104 deliveries.
- **What it costs:** 334 high-value orders (8.4% of at-risk orders) hold 36% of the R$720.9K at risk. This value is not concentrated in the worst-delay categories, so category fixes alone will not recover it.

Recommendations

1. **Protect high-value orders.** Give them priority handling and reliable carriers; they carry over a third of the revenue at risk.
2. **Target the worst states and sellers.** Review carrier performance in the worst states and set delivery-time expectations for the worst-performing sellers.
3. **Pilot delay communication.** For orders heading toward 1–3 days late, test proactive notifications and see whether the 1★/5★ split narrows before investing more widely.

Caveats

- This is descriptive analysis: delay is associated with low ratings, not proven to cause them.
- The estimated delivery date is the seller's deadline rather than a carrier promise, reviews are self-selected, and orders without a delivery date (3%) are excluded.

Decision requested

Approve a pilot of recommendations 1 and 2, measured by the late rate and the share of 1–2★ reviews in the targeted segments.
